### Medium Black Lava Rock

Any amazing gas fire feature begins with a proper and solid base. You can use fire glass or fire stones in your fireplace alone, but for deep set fire pits it is best to lay down a lava rock base. Not only is it lighter weight by mass (ten-pound bag of lava rock will fill as much area as twenty pounds of fire glass) but is more cost effective for your fire pit project.

This material can be utilized inside and out and can withstand high temperatures in any fire feature because of the natural process magma goes through when cooling. As the magma nears the surface and cools, the rock releases gas bubbles that forms the coarse rough surface in the lava rock.

These medium sized rocks are 1/2 an inch to 1 inch in sizes and vary in color from brown to black, this is normal.

Whether lava rock is your base covering or you choose to use only it in your fire feature, you are purchasing a material that is durable and long-lasting. Of course, you may decide you like the look of the lava rock by itself, especially if you are creating an outdoor fire pit or you have a more tropical theme established in your décor.

American Fireglass sifts, sorts and packs all of our lava rock by hand. This way we can guarantee that they are top quality, can be used in a firepit and have no left-over gas pockets that could burst. For optimal results, our recommendation is to pour a minimum of two inches of lava rock over the firepit burner, which allows the gas to filter evenly through the lava rock media. Remember to cover your firepit when not in use and do not use the fire feature when wet.

### Medium Black Lava Rock Specifications

1. **Material:** Lava rock
2. **Size:** 1/2" to 1"
3. **Color:** Brown to black

4. **Weight:** 10 Lbs.
